

Our father began showing signs of Covid on Christmas Eve, 2021. He was not vaccinated. Myself and 1 of my sisters contracted it days later. I had a Nurse Practitioner friend do a health hx at home, called him in Ivermectin, a nebulizer and budesonide. He was not eating well, was given a lot of fluids as hospital notes indicate he was very hydrated upon arrival.

Garnet Health Medical Center in Middletown, NY was advertising monoclonal antibody treatment through their Middletown Medical Urgent Care Center. Myself, my oldest sister and our mother, drove him on January 2, 2022. They turned him away, they were booked for the day but to come back in the morning. I was too sick with double pneumonia to make the drive. As his Health Care Proxy gave my sister a written letter which they turned away and would not accept. They told my sister and mother the next day when they arrived that he was a very sick man and needed to be admitted after telling them that they do not offer MAT. Our father qualified and as a healthcare professional and physical therapist of over 20 years, I looked up the protocol.

They claimed they could not get an O2 reading in the ER. They admitted him to their hospital Garnet Health. Dad was a mouth breather with a deviated septum, wearing a mask and he was 84 years old, they could have had him remove his mask and take a few deep breaths. He was driving in the community and walking a few miles a week with minimal health issues. Common sense went out the window as they had an agenda. They wanted him admitted. The ambulance that transported him had no problem getting an O2 reading that was 86%. He was fearful of being left and abandoned which also affects breathing and had the hospital suggested that he take deep some deep breaths to relax, that O2 (of which I have taken thousands) level would have come up to 88% or above which does not requires supplemental O2.

Our father was alert and oriented x 4 upon admission to the Hospital. Within 2 hours he was only oriented to person x 1. Upon admission, they were instructed by my sister, no Remdesivir and no Vent. He survived Covid and was due to come home on 1/7/22 as he was breathing on room air and O2 saturation level was 100% according to notes on Thursday, 1/6/22. I have read thousands of hospital notes, the doctor went into his room on that evening, Thursday, 1/6/22, there was a turn of events & no notes indicating what happened.

They injected him with Haloperidol on 1/7/22 due to his "behaviors", gave him a heart attack with the first IM injection. EKG and troponin levels, both of which indicated heart failure post injection. They continued to alternate Ativan & haloperidol, both being contraindicated with heart disease. Haloperidol was given through his IV repeatedly for days although not FDA approved for IV use. I spoke to the Dr. on 1/8/22 after our sister was informed he had a heart attack and there was nothing more they could do. I called the Dr. and stated "we are taking him home". I instructed no more drugging him up and denied morphine use, remdesivir and vent use. The doctor had an attitude.

We agreed to hospice services just to get him out of there. They dragged it out for 3 more days. They had made him NPO and asked about a feeding tube which I declined because we

were taking him home but they never addressed his nutrition the next 3 days. They gave Dad an emergency use authorization drug Tocilizumab after his MI, never discussing it with me and made him worse. It too was contraindicated with heart disease.
