

FOR THE RECORD

My name is Jake Hanson. I submit this testimony regarding the hospitalization and death of my father, Paul Hanson., at Mercy Hospital in Coon Rapids Minnesota in May 2021.

My Father was a healthy 56-year-old. He was a happily married man for 30 years to my mother Kelli Hanson, a loving dedicated father of three children and at the time a grandfather to one but since his passing eight beautiful grandchildren who now know of their Pops from the incredible legacy he left on all of us.

During his 36-day hospitalization, thirty-three of those days he was on a Ventilator. My father received two rounds of remdesivir even after never testing positive for Covid in the hospital (He tested positive PCR on the 14th before his hospitalization), We requested and demanded Ivermectin and Hydroxychloroquine multiple times but were denied.

During his first couple days in the hospital, he and our family were clear that the ventilator was not something he wanted to be on. He was on a CPAP machine for the first couple days - he was vomiting and showing signs of bacterial Pneumonia. My mother and sister were in the room with him that evening communicating with him until he was resting comfortably for the night. Out of nowhere they rushed him to the ventilator and ripped his shirt off, forcing my mom to leave and make an impossible decision as she saw my dad's eyes wide open and confused. This event still causes many questions including Licensed RN and medical professionals who did a complete medical record review on his entire case.

While on the ventilator I have videos on my phone of him following my voice commands I even have memory of him nodding to me that he was in pain. They continued to dose him with anxiety medication, insisting that he was struggling and fighting the ventilator.

During his stay in the ICU the hospital staff denied any alternative treatment and stated that they must follow the NIH protocol. They claimed that vaccinated individuals would be saved from this and insisted we all get the shot. This only added to the exhaustion of what we were clearly witnessing as a medical treatment nightmare.

Our family retained a legal Licensed Nurse consultant to independently review my father's complete hospital records of his entire 36-day hospitalization, and it was determined he had sepsis within the first hour of being hospitalized - every sign was there. The Golden hour protocol was ignored and this led to declined health. The review also showed that the hospital ignored treatment for Bronchopleural Fistula (his lung popped) and contradicted themselves in failing to treat it with other "treatments" that suited their protocols.

I recognize the challenges that healthcare professionals faced during what we now know and some of us knew then was a genetically engineered Coronavirus. What I do not recognize was an honest effort to treat my father. Ivermectin and hydroxychloroquine was clearly campaigned against because it took the EUA of the vaccine away. Had we known about it before he was hospitalized my father would never have gone to the hospital. They threw him on a ventilator, did not treat his bacterial pneumonia, had organ failure from Remdesivir and blew his lung up from the Ventilator and failed to treat it. This country cannot brush over the fact that millions of people were killed from corrupt hospital treatment protocols. Accountability must take place, and I pray that our elected officials will have the courage to see it through.

Respectably submitted,

Jacob Paul Hanson
