

My mom had to call an ambulance for my father who was very lethargic and unresponsive after being Covid positive for several days. He was taken to the hospital, Northeast Georgia Medical Center Habersham (I believe). I told my mom not to let him be given remdesivir knowing this was associated with many bad outcomes. The ER told her they wouldn't administer it. He improved in a short time in the ER but then was admitted to ICU. I tried to reach out to the hospital administer by email to share my concern (no recondition). I should be able to find the email I sent. To my knowledge he wasn't diagnosed with any condition but had some issues with kidney function. When isolated from family he was given remdesivir and quickly went downhill. He was vented and the hospital told my mother he needed dialysis but they could find a unit within hundreds of miles. Shocker (sarcasm ... apologies). Death came quickly afterwards. I don't know if/what records my mom may have. I asked her to get all his records from the hospital, but she was reluctant and preferred to just accept things as they happened. I have honored her wishes and it would make it difficult for me to give testimony without her blessings and support. Knowing he responded well in the ER and then was given remdesivir there isn't a doubt in my mind that their protocols lead his death. Thank you for hearing the citizens of the country on this topic. I know you have been tackling a lot of related topics around COVID-19 including vaccine injuries for quite some. BTW, neither of my parents took any of the covid vaccines. My mother had tested positive at that time as well but never required any in facility care. Since she was covid positive it made it even more difficult for her to be there for my father in his last days. I entered a date when I think he may have been admitted above. The date he died is shown in his obituary below. In God's care may he be now.
