

Covid death testimony

January 21, 2021. That was the worst day of my life. Chrissy Tabitha Leahy, my daughter, aged 40, died that day from Covid.

This is an account of the circumstances surrounding her death.

She was a sufferer of Crohn's disease and contracted Covid on Christmas Day 2020. That would be the last time that I see her. About a week after she contracted Covid, she was hospitalized at Southwest Healthcare Inland Valley Hospital in Wildomar, CA. They put her on a ventilator and followed hospital protocol for Covid. Eventually her organs gave out, and she died on January 21st. We never understood why she had organ failure as she had no previous conditions around her organs, only her GI condition due to Chron's. I find her death suspect as she was a 40 year old female. Her immune system was compromised which led to her contracting Covid, but nothing in her history would have caused organ failure other than the medication given to her during her hospital stay.

None of her family, her husband, her kids or her parents could go visit her in the hospital. I started a GoFundMe page to help her family of four. Three kids, 16, 11, and 3, and her husband.

I posted about the incident on Facebook and shortly thereafter was contacted by ABC News. There was a news report that outlined the tragedy and the fact that we couldn't go visit her in the hospital. We couldn't understand why hospital staff including nurses, doctors and even janitors could dress up in gowns and masks and yet her family could not.

I still miss her everyday.

Patricia Warble, mother
