

Mark, was admitted to HCA Houston Healthcare Conroe 08/12/2021. He had been ill for 8 to 9 days. My sister took him in to the ER and became his advocate. Pulse Ox 80%. Breath sounds NL, No respiratory distress. X-ray possible pneumonia, temp normal. Covid test taken and started on oxygen. Day 12 and 13 Doctors immediately pressured for use of Remdesivir. My sister asked for Monoclonal antibodies, vitamins, hydroxychloroquine and/or Ivermectin all were refused. Food, water, and personal hygiene were ignored. Blood thinners Loenox were given daily he was not allowed to get out of bed. Medications Dexamethsone (suppresses the immune system), ceftriaxone sodium, Enoxaprin, Albuterol, Dextromethorphan, ondansetron, Morphine, Acetaminophine, hydralazine, ondansetron. Day 13 doctors note (treat as covid.)? I was in the hospital as well on the 13th I was told Mark was improving and would possibly be out before me. He was up and eating a double decker sandwich. On the morning of the 14, I was advised, my sister had been removed as Mark's, advocate and replaced by his daughter who gave uninformed consent for the use of remdesivir. I was not consulted as his wife, possibly because I was refusing to take Remdesivir. My sister tried to get the doctors to read the studies before administration. She told the doctors, it would kill him. It was not to be given to diabetics. His was controlled with pills and diet. On day 14 his check list was normal, but he was placed back on the Bipap, oxygen was placed on high flow and given Remdesivir. Two doses 100MG and 200mg, along with all the previous meds. Furosemide, insulin, Famotidine, lacted ringers were added. Morphine continued. Day 16 doctor had a full discussion with Mark about advance directives. Days 17, 18, are missing from his records. Day 19 acute Respiratory failure. Day 20 note remdesivir completed on the 17th. started Celepime/Azithro. Day 21. Meds Vecuronium, Fentanyl, Norepinephrine, Midazolam, propofol, Etomidate. All other meds were continued as well as Morphine. Noted: Acute kidney injury. vented. Other meds Epinephrine, Sodium chloride. 08/22/says meds include Lorazepam, Morphine all other meds. During this time I was kicked out of the hospital for refusal to follow hospital protocols. I was sent home with an oxygen machine. Sometime after the 17th doctors started calling me telling me Marks condition was getting worse. I was pressured to sign an DNR for several days. On the 22nd I was informed Mark was clinically gone. that afternoon he was taken off life support under pressure from hospital staff. I was still sick My sister was able to get a doctor to prescribe Hydroxychloroquine, and vitamins. My story doesn't end here. My niece died two weeks after Marks funeral, same protocols. In December 2021 my brother-in-law passed same protocols. Later my father 80 was in the hospital for nearly a month. He was neglected, stinky, had bed sores. They would not treat him for his heart arrhythmia due to our refusal to allow the use of Remdesivir. He is still with us but not without a fight, that has left its mark on me and my family. I no longer Trust doctors and have developed such a fear of them, that I haven't seen one since. I now suffer panic attacks and was unable to take my dad to the ER recently. There's not enough room to adequately tell the whole story. As I myself am disabled due to a previous Brain Tumor, the impacts are profound. Thank you for your attention to this matter.
