

Dear Senator,

I am fully aware my story is not as heinous as others I have heard. But I am willing to fly out to testify if you need an additional person. You did say all testimony to add to the record would be helpful. This is my hospital protocol story:

On or about September 15th 2021 I woke up that morning unable to breathe very well. A friend I called suggested I call 911. I was packing a bag in case I had to stay, I went to brush my teeth and discovered I had grey/purple skin. For all intents and purposes I was suffocating to death. I called 911 and was transported to the hospital. I ended up in the hospital for 5 – 6 full days, the only interaction I had with anyone was a nurse or short doctor visit when they had to come into my room otherwise I was alone

In the Emergency Room I don't understand why I had to receive a Foley catheter so the hospital could run a urine test to be sure I didn't have additional infections. I never indicated that I had any other issue other than not being able to breathe. The only infection indicated on lab reports was Covid 19. I offered and was perfectly capable of providing a clean catch urine test in the bathroom and the hospital refused to allow me to do so.

I don't recall ever signing a consent form for the hospital. I was never told unless I asked what I was receiving in pill form. I had no idea the IV I had was Remdesivir. I believed it was just a saline bag for fluids. It was the fifth day I could actually see the bag the nurse hung up and saw that it was Remdesivir. I was never told I was receiving that.

Immediately after my hospitalization I had extreme difficulty with blood sugar levels when I didn't prior to my hospitalization. I was well controlled on Metformin at 500mg prior to the Remdesivir. Medication had to be doubled and it still didn't seem to help control blood sugar levels after that intravenous drug. I am no longer diabetic thanks to a new doctor I have to pay out of pocket as they don't take insurance. I have to restrict to eating only one hour a day and fasting for at least 23 – 24 hours between that one hour.

I did not take the shot prior to that hospitalization. My doctor insisted that I didn't need to wait after getting out of the hospital any amount of time before I could get it. The hospital as far as I recall did not inject me with the shot. I am now injured from the shot because I had a trip coming up about 6 months after my hospitalization and the CDC was still requiring proof of the shot to fly.

By September of 2021, hospitals should have known about the problems with Remdesivir. Yet I still received that drug which most likely has caused some internal damage to organs, I refuse to go back to doctors for additional testing. Hospitals should have known about other treatments I was unaware at the time of the problems either based on the censorship taking place surrounding all things Covid.
